TEXTIL NONWOVEN COATING & CONVERTING PAPIER EXTRUSION

ORTHOPAC® RVMC-15

A modular designed system for fully automatic skew correction and process control

Area of application

Textile manufacturers and textile outfitters are fighting with increasing production and energy costs, declining profit margins, shorter production times as well as greater requirements on quality and flexibility. Cost-efficient and quality-focused textile outfitting thus becomes increasingly important. Sustained production and the trend to higher-quality, technically sophisticated textiles also play a major role.

Regardless of the challenges of the textile industry – Mahlo has the right solutions ready. The broad range of applications for the textile industry by Mahlo is based on experience reaching back to the year 1945.

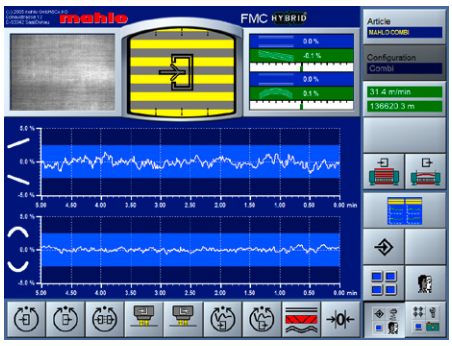
Product highlights

- ✓ Modular system architecture
- ✓ Easy to retrofit
- ✓ Operator-friendly
- ✓ Informative process visualization:

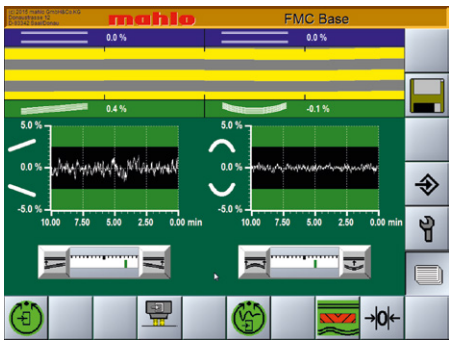
Orthopac is a modular straightening and process control system available throughout the entire process of textile outfitting. It combines the functionality of a weft straightener with that of a process control system in one compact device. It automatically ensures a straight-thread product before and after the drying or fixing process and optimises the processes all around the stenter. This increases quality and saves resources and energy. The modular design of the system allows its flexible adaptation to all applications. Both, standard requirements and highly customized demands are thus met.

Benefits for the customer

- ✓ Online monitoring and regulation of all relevant parameters
- ✓ Increased productivity
- ✓ High production reliability
- ✓ Optimised process repeatability
- ✓ Documentation of quality
- ✓ Providing a comparative basis for the quality standard
- ✓ Considerable energy savings
- ✓ Short amortisation times



User interface of Orthopac RVMC / straightening system



User interface of Orthopac RVMC Base

Better quality of goods, straight-thread product and saving resources in a single step: thanks to the **straightening and process control system Orthopac®** from Mahlo®.

Principle of operation

The weft straightener Orthopac with integrated web distortion detection forms the basis of the modular design. Additional intelligent sensors can be connected to the control system via a bus connection.

The following process parameters can be measured, visualized, controlled and documented by means of special software packages (Print Server).

- Weft thread or course skew / skew and bow rollers of the straightener Orthopac RVMC
- High moisture / squeezing pressure
- Thread or course density / over-feed
- Exhaust moisture / fan speed / flap opening
- Surface temperature / product web speed and dwell time
- Surface weight / over-feed
- Residual moisture / product web speed
- Stretch and shrinkage / over-feed
- Product width

The touchscreen of the weft straightener displays the measurements. Various software packages (FULL or BASE) allow adjusting visualization and operating concept to different demands on detectability and user convenience. Individually modifiable combination displays of the measured values, entirely according to customer preference, facilitate easy monitoring of the complete process by the user.

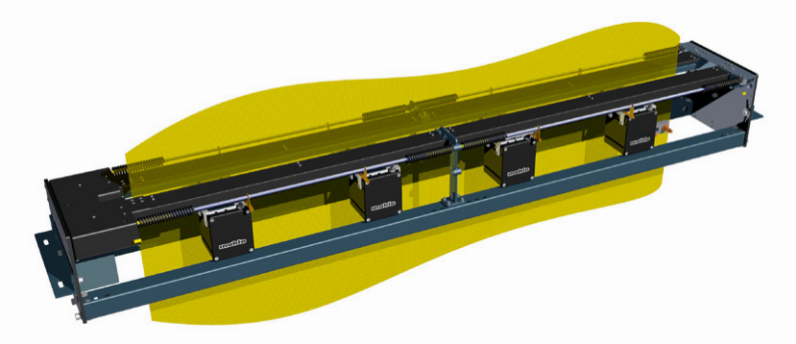
ORTHOPAC FMC

BOW AND SKEW DETECTION – SIMPLY UNIQUE



Distortion detection Orthopac FMC: The scanning system is integrated in the straightening system or available as standalone device exclusively for distortion detection.

Product highlights

- ✓ Optimized optics for the greatest possible angle resolution
- ✓ Direct, non-delayed signal processing for fastest determination of angle distortion
- ✓ Optimized transmitted and incident light system
- ✓ Integrated pick or knitted-course count
- ✓ No product-specific adjustment required
- ✓ High-speed scanning
- ✓ Product change detection
- ✓ Integrated recipe management
- ✓ Two-sided scanning possible

Benefits for the customer

- ✓ Broadest scanning spectrum on the market
- ✓ Simple, intuitive operation
- ✓ Automatic scanning even of the most complex product structures
- ✓ No residual distortion
- ✓ Greatest functionality with the smallest physical dimensions

Area of application

The straightening system Orthopac detects and removes web distortions automatically. The FMC integrated optical distortion detection Orthopac is capable of handling the variety of usual colours, print and Jacquard patterns as well as surface structures such as pile and loop. The scanning system detects and analyses the regular basic structure of the weft threads, courses or rows of tufting. If necessary, their density is determined at the same time.

For the control of various straightening devices, for pull-off rollers, chain differentials and multiple motor drives: The FMC distortion detection Orthopac constitutes the universal automatic straightening system. It can be installed upstream and downstream of a wide variety of production plants. Equipped with digital scanning and state-of-the-art processor technology, it adapts the control automatically to different textiles and displays distortion changes ergonomically and conveniently on the screen.

Principle of operation

Web distortion in textiles can be determined in several ways. Distortions alter the regular bright-dark patterns in an illuminated moving fabric. The classical approach is to detect this signal modulation with an optical sensor (modulation principle). Apart from this, camera scanning can be used or both principles of function can be combined.
The scanners of the automatic straightening system Orthopac must record the distortion immediately behind the straightener to be able to detect the result of the control process as quickly as possible.

The industrial PC communicates via the control system with the scanners and roller adjustment mechanism. It can be networked with a host computer and print out distortion logs for quality documentation. Employing Ethernet technology reduces the wiring effort considerably. The Mahlo Service department can be contacted via remote diagnostics software.

The touchscreen of the weft straightener displays the measurements. Various software packages (FULL or BASE) allow adjusting visualization and operating concept to different demands on detectability and user convenience. Individually modifiable combination displays of the measured values, entirely according to customer preference, facilitate easy monitoring of the complete process by the user.

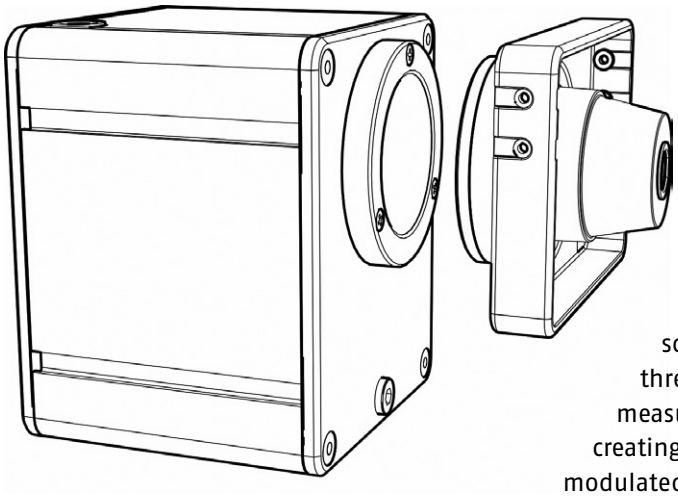
Enhanced Printserver: Protocol view with the viewer

TEXTILE NONWOVEN COATING & CONVERTING PAPER EXTRUSION



Scanner TK with reflex light (integrated) and transmitted light

Optoelectronic scanning according to the modulation principle (scanner TK)

A number of scanners and lamps are spaced evenly across the product web. The product runs between scanner and lamp. The structure of the passing weft threads and courses modulates the light intensity measured by the scanners. The structures repeat regularly creating bright-dark patterns. These patterns generate a modulated signal in the scanner's receiver system. A centrally-pivoted, cylindrical lens in the scanner oscillates to a specific angle in relation to the desired direction of the weft thread. When the lens is parallel with the weft thread, signal modulation is at its maximum. It then decreases as the oscillating lens progressively cuts across the weft line. Interfering signals not agreeing with the frequency of weft threads, courses or rows of tufting are filtered digitally.

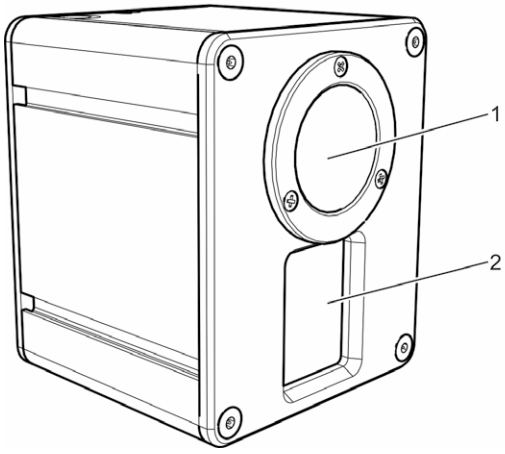
Only signals relevant to distortion are analysed and the web distortion is calculated automatically and precisely from this. By using a lamp with infrared LEDs, the light shining onto each scanner can be controlled automatically and individually. The lamps have a longer working life and consume far less energy; two further attributes of the LED technology.

If textiles barely allow light to shine through them, or their surface texture has distinguishable characteristics, better results can be obtained using reflected light rather than transmitted light.
The scanners are therefore equipped with integrated infrared sided light with automatic intensity control. It can be activated instead of the lamps for transmitted light.

Image scanning (scanners HTK or CTK)

Several high-resolution cameras placed across the product width scan the passing material web. The angle of the weft thread is determined by FFT analysis. Interfering signals not agreeing with the frequency of weft threads, courses or rows of tufting are filtered digitally. Only signals relevant to distortion are analysed and the web distortion is calculated automatically and precisely from this.

Suitable lighting versions (reflex light, transmitted light, power lights) are available also featuring automatic adjustment of the light intensity to different material grades.



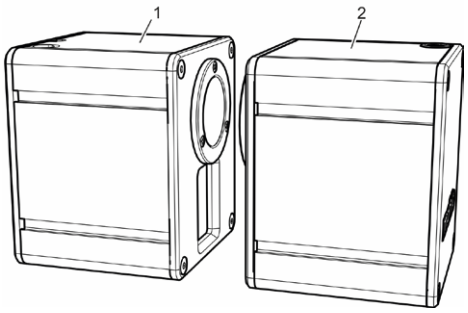
Scanner HTK

1 Lamp (active only with hybrid scanning)
2 Camera

Hybrid scanning

Optoelectronic (TK) and imaging (HTK) measuring principles can be optionally combined into hybrid scanning. Combining two independent processes creates a superior scanning system which utilises existing synergies to an optimal degree.

The two scanning system hereby detect the product passing between the scanners from both sides. The respective more suitable system assumes control of the detected distortions. Mahlo hybrid scanning therefore constitutes the scanning system with the widest dynamic range and greatest scanning spectrum on the market.



Hybrid scanning with scanner HTK (1) and TK (2)

Scanners (here with the hybrid system) in action

BASIS

VISUALIZATION

EVERYTHING AT A GLANCE

TEXTILE NONWOVEN COATING & CONVERTING PAPER EXTRUSION

Product highlights

- ✓ Clearly arranged presentation of the distortion characteristic
- ✓ Menu-controlled service settings
- ✓ Two-part combination image for simultaneous monitoring of two scanner units
- ✓ Distortion default as percentage, adjustable (left: skew, right: bow)
- ✓ Direction of product flow and momentary characteristic of the weft
- ✓ Current web distortion as percentage (left: skew, right: bow)
- ✓ Trend diagrams (top: skew, bottom: bow) freely scalable
- ✓ Image scale of histogram, selectable, e.g. -5...0...+5 (top: skew, bottom: bow)
- ✓ Password protection – unauthorised users are prevented from accessing the operating software
- ✓ Recipe management

Benefits for the customer

- ✓ Menu guide in all common languages
- ✓ Very user-friendly
- ✓ Ergonomic user prompting
- ✓ Ease of operation

Use of the touchscreen technology replaces a control unit with pushbuttons and switches. All entries are made directly on the screen using large, ergonomic buttons. Operation is simple and intuitive. All key information is visible at a glance.

Visualization and operation per touchscreen

Various versions of the operating software are available for individual use:

- The **FMC** full version offers all setting capabilities and options to the entire depth. The full potential of the straightening system can thus be utilized.
- The FMC Base version focuses on the essential functions of the system and offers a compact and simple overview for thecontrol of the processes.

TEXTILE NONWOVEN COATING & CONVERTING PAPER EXTRUSION

ORTHOPAC RVMC

PERFECT INTERPLAY BETWEEN MECHANICS AND ELECTRONICS

Area of application

The Orthopac RVMC is the universally employable straightening system from Mahlo for the correction of web distortions for nearly all applications.

It is precisely designed for the demands of the textile industry and can be adapted to the individual requirement through its modular make-up. The user obtains a sophisticated straightening system with maximum possible customer benefit with respect to versatility and operating convenience.

Through interaction with the suitable scanning system web distortions are corrected exactly and without delay. All this is marked by simple operation of the system and unparalleled rugged construction.

The modular construction allows the system to be configured to meet the demands of changing conditions and requirements. The straightening system RVMC is employed:

- at the stenter entry
- at the feed end of a levelling stenter
- on detection systems
- before printing systems
- between open width washing machine and drum dryer
- in coating equipment before the coater on the feed end of flame laminating machines
- at the feed end of wide compactors for knits, etc.

Product highlights

- ✓ Highest alignment accuracy
- ✓ Fast-reacting servo-controller
- ✓ Progressive straightening speed
- ✓ Very compact construction
- ✓ Low goods content
- ✓ Numerous options

Benefits for the customer

- ✓ Maintaining tight distortion tolerances
- ✓ Avoiding complaints
- ✓ Improved customer relationship
- ✓ High repeatability
- ✓ Short amortisation times
- ✓ High reliability/Service life

RELIABILITY

Our machines do exactly what we build them for: Hour after hour, year after year. Making sure you will always reach your goal.

Principle of operation

The strength of the Orthopac RVMC is the combination of high straightening accuracy and progressive straightening speed. The compact straightening module is equipped with 3 skew and 2 bow rollers as standard. The product flow concept is optimized for the system to quickly respond to changing web distortions. The stepless positioning drive for the straightening rollers with the unique hydraulic unit combines the shortest positioning times with maximum precision and minimal maintenance. Two independent hydraulic units, each with servomotor and reversing pump with variable speed and rotational direction for the selection of individual cylinders (skew/bow), guarantee maximum efficiency at lowest heat development.

Orthopac RVMC am Einlauf einer Kalanderanlage im Textildruck

As an alternative, a stepless, electromechanical drive concept for the adjustment of the skew and bow rollers with rapidly responding servo-controller and frequency-controlled electric motors is available.

The analysis electronics with powerful CPU, Ethernet interfaces and power link are integrated in the side panel of the straightening system. The electronics as well as drives in the side panels provide excellent access and little maintenance. The touchscreen for visualization: of the weft thread position and all relevant process parameters is installed either on or in the straightener's side panel or supplied separately with or without enclosure.

Classic feed-end straightener in textile production

The scanners (TK, HTK or hybrid) for the automatic straightening control are integrated at the delivery end of the weft straightener in a so-called scanner bridge. The scanners can be positioned over the width of the product either manually or motorized. Optional edge sensors automatically adjust the sensor position to the product width.

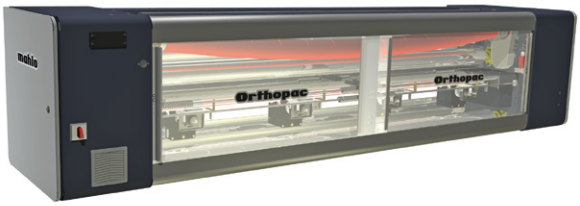
Modern network technology enables short installation times and allows for ease of upgrading. The compact, solid construction of the mechanical straightener is capable of handling highest loads. Possible processing speeds range from 3 m/min to 250 m/min. A variety of options ensures optimum configuration of the system to the respective application and types of product to be straightened.

TEXTILE NONWOVEN COATING & CONVERTING PAPER EXTRUSION

ORTHOPAC MFRC

COMPACT AND PRECISE

The special strength of the Orthopac MFRC is the extremely high straightening accuracy at relatively small distortions.



Area of application

Stenter delivery end:
With the MFRC straightener the residual distortions often occurring at the delivery end of the stenter are straightened after the drying processes (bow and skew distortion). This ensures maintaining even the slightest residual distortion tolerances.

Sanforizing equipment:
Product with residual distortion needs to be straightened before sanforizing. If a sanforizing system is not equipped with the Orthopac MFRC straightening unit, the product may need to be fed through the stenter a second time. An Orthopac MFRC before the sanforizer can avoid this cost and guarantee a distortion-free product after sanforizing.

Printing machines:
A distortion-free product is one of the most important prerequisites for a print. The straightening process immediately before the printing machine is the last opportunity to correct distortions. With the Orthopac MFRC reduced quality from printing on distorted product is significantly reduced. The cross slide with photoelectric edge sensing aligns the product path to the print edge.

Flame laminating machines:
In flame laminating the product must be fed to the laminating roller with absolutely no distortion. No corrections are possible after flame laminating. With the Orthopac MFRC immediately in front of the laminating roller the portion of second-quality product can **be reduced by approx. 80%.**

Product highlights

- ✓ Very fine metering of the alignment effect
- ✓ Compact dimensions
- ✓ Low product content
- ✓ Fine-tuning of distortion

Benefits for the customer

- ✓ Maintain the tightest distortion tolerances
- ✓ Avoiding complaints
- ✓ Improved customer relationship
- ✓ High repeatability
- ✓ Short amortisation times

KNOWLEDGE

We have a common goal: Maximum performance for your system. To this end we are by your side from installation to maintenance of the machines to training of your employees. We provide comprehensive training to your staff for operation and maintenance. You will thus be able to solve problems even faster.

Principle of operation

The compact straightening unit is equipped with a skew and bow roller as standard. This arrangement allows for very fine adjustment of the straightening effect while permitting small device dimensions.

The stepless positioning drive for the straightening rollers with the unique hydraulic unit combines the shortest positioning times with maximum precision and minimal maintenance. Two independent hydraulic units, each with servomotor and reversing pump with variable speed and rotational direction for the selection of individual cylinders (skew/bow), guarantee maximum efficiency at lowest heat development.

As an alternative, a stepless, electromechanical drive concept for the adjustment of the skew and bow rollers with rapidly responding servo-controller and frequency-controlled electric motors is available. Scanner, electronics, display and operating station, etc. correspond to the standard design Orthopac RVMC. Processing speeds range from 3 m/min to 250 m/min.

STRAIGHTENING COMBINATIONS

Linking of straightening systems

FOR MAXIMUM DEMANDS

Product highlights

- ✓ Combines all the benefits of different straightening units
- ✓ Data management for seamless documentation

Benefits for the customer

- ✓ Maintain tightest distortion tolerances
- ✓ Avoiding complaints
- ✓ Improved customer relationship
- ✓ High repeatability
- ✓ Short amortisation times
- ✓ Documentation of residual distortion

LISTENING

Our sales team knows how to listen: Gathering the individual requirements, preferences and ideas from our customers, they give the right direction to our product developers. This makes sure you get exactly what you really need.

Area of application

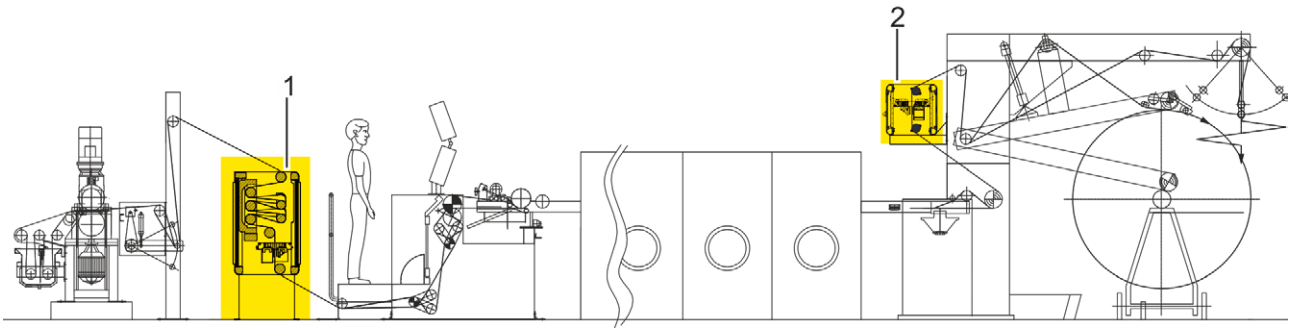
Maximum requirements regarding residual distortions often necessitate very special straightening concepts. Mahlo has responded to this demand and developed individualised solutions. This is necessary since in many cases straightening before the stenter is not sufficient. Web distortions, especially bows, may occur again in the stenter itself.

Scanning after the stenter pull-off roller therefore records the weft thread configuration. Residual distortions are actively controlled via the speed control of the pull-off roller and the Orthopac MFRC straightening unit.

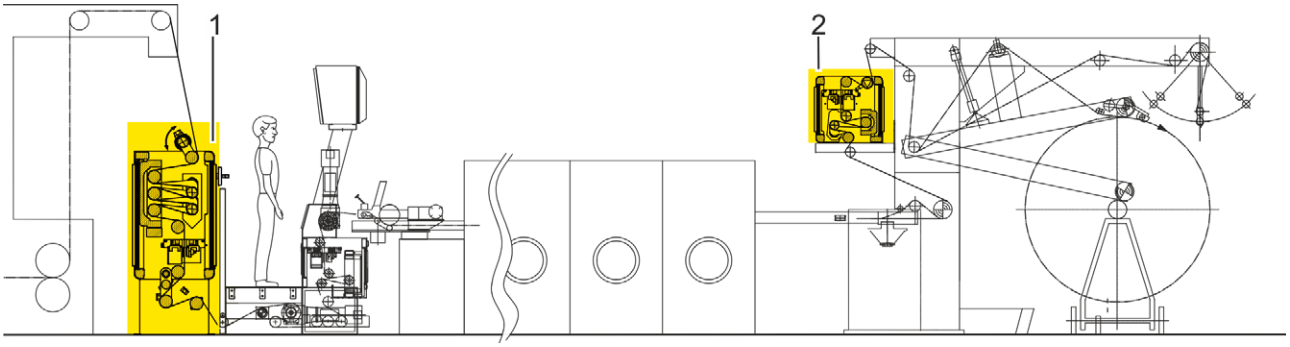
Principle of operation

Because smaller residual distortions are primarily precision-straightened with these applications at the delivery end of the stenter, Orthopac MFRC is especially suitable here. This arrangement allows for very fine and accurate adjustment of the straightening effect while permitting small device dimensions. Since the product only needs to be fed over a single straightening and a bow roller, the system responds reliably to the smallest amounts of distortion, and in this respect offers advantages over a traditional weft straightener.

Mahlo has accommodated the change from standard solutions to customized concepts. Individual consultation by our optimally trained sales personnel combined with the long years of experience in process-technology represent the basis for detecting problems and working out concept solutions.



Combination system for wovens: Straightening and process control system Orthopac RVMC (1) in the feed-end of the stenter in combination with a scanning bridge Orthopac FMC (2) in the delivery end



Combination system for knits: Straightening and process control system Orthopac RVMC (1) with web tension control and spreading roller combined with a straightening unit Orthopac MFRC (2) at the stenter delivery end

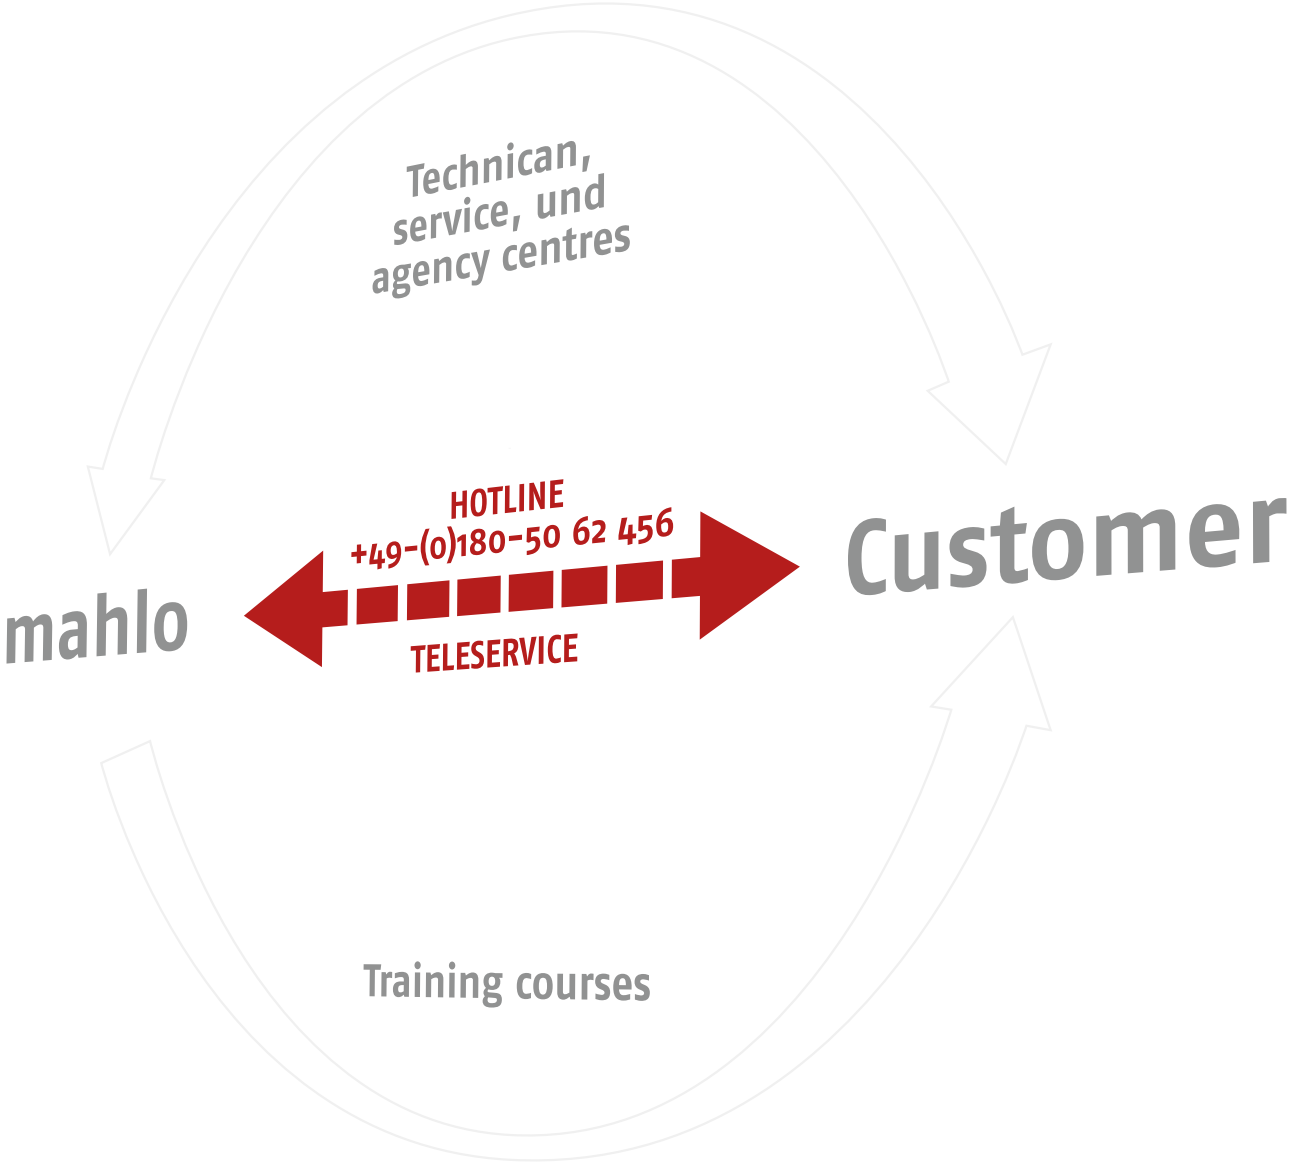
SERVICE AND SUPPORT

TEXTILE NONWOVEN COATING & CONVERTING PAPER EXTRUSION



For decades Mahlo® has been setting standards in the field of measuring and control systems for the textile industry: Using innovative and trend-setting technology.

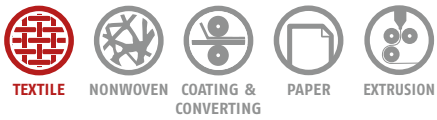
In addition to the technology, direct contact with our customers is especially important to us. This includes intensive assistance and customer care wherever the customer is located and a global service and representative network including 24-hour replacement part service.

Mahlo customers can safely count on the know-how of our experts in any situation, whether installation and startup, conversion of existing systems or maintenance of their machines.

TECHNICAL DATA | ORTHOPAC FMC

Distortion detection	Orthopac FMC
Scanning	Scanners – TK – HTK – Hybrid (TK + HTK) – CTK
Signal generation	Photoelectrical measurement with oscillating lens (2 – 16 scanners) and image projection (2 – 8 scanners) Two-sided scanning, angle resolution: 0.1 ° Detects weft threads and patterns up to 180 picks/cm
Optics	Fixed focus (no adjustment required)
Illumination	Infrared LED illumination: Transmitted light, reflex light and flash lighting with automatic intensity adjustment
Signal processing	DSP, microcontroller and IPC in real-time Visualization via IPC and touchscreen
Automatic control	Software controller, PID type, speed-dependent, separate skew and bow component
Display and operation	Touchscreen colour monitor with selectable screen pages; main page: Distortion graphic, histogram and additional numeric distortion display; various service screens
Product speed	0 – 250 m/min
IP protection class of scanners	IP64 (dust and water spray-protected)
Options	Corrosion protection and cooling

TECHNICAL DATA | **ORTHOPAC RVMC**



Straightening device	Orthopac RVMC
Straightener	3 skew rollers, 2 bow rollers (optional 3)
Straightening roller adjustment drive	Hydraulic: Selection via servomotor and reversing pump Electrical: Selection via asynchronous motor through frequency converters
Straightening rollers adjustment time	Adjustable bow and skew rollers 0 – 100%: ≤ 2.5 s
Theoretically max. possible straightening effect (at full utilization of the nominal product width) (at w = 1800mm)	skew ±750 mm bow ± 220 mm (2 bow rollers; at 3rd bow roller + 50%)
Max. nominal product width	3400 mm
Max. product speed	250 m/min (without tension control), 150 m/min (with tension control)
Fabric capacity (basic machine with scanning system)	3 skew / 2 bow rollers: ~3280 mm
Scanning system	Scanner bridge with 2 – 12 scanners, optional fully automatic scanner adjustment, motorised (2 – 8 scanners) with edge sensor or manually via highquality linear guides with engagement points
Dimensions	See diagrams
Weight (when w = 1800 mm)	~ 950 kg
Power connection	3~ 400 V/50 Hz, transformer available for other voltages
Max. power consumption	4 kVA
Ambient temperature	5 – 45 °C (without A/C unit) 5 – 50 °C (with A/C unit)
Control and display station	12.1" TFT Touchscreen available as integrated, add-on or separate (with or without enclosure) unit
